

PRD - Sports Betting App

Section 1 - Group 9

Owen Smith
Easton Putnam
Will Fairholm
Marcus Williams

Section 1: Problem Summary

People bet to make the games more exciting, but the only way to get that excitement today involves risking real money, and the apps are built to keep you from winning.

Sports betting has really surged over these past couple years and every other ad is trying to get you to start betting. They offer promos and deals to try and entice you into their ecosystem. The problem is, gambling is highly addictive and you almost never come out on top. The companies would be out of business if they wanted you to win. Bettors are always chasing a high of winning a bet and they often don't care what it costs them on the other end. Our research shows bettors use sports betting to increase the excitement of watching a game. It seems that no alternatives exist to add onto the sports experience not involving the risk of losing money.

Instead of real money, users bet with their phone's screen time. Winning a bet earns them more screen time, and losing a bet takes it away. This keeps real stakes in the game without putting anyone's money at risk, and it can even help users spend less time on their phones.

Section 2: Scope

Must Have:

1. Interface accessible to all users (works on iOS and Android)
2. Bet settlement (automatically paying out when a game ends)
3. Real-time/live sports updates, including odds
4. Betting screentime feature (have a set amount of screentime that you can bet with to get more / loose with bets) (User is betting with the next day's screentime)
5. Bet sharing (share bets between friends to have alternatives to screentime)

Should Have:

1. Overall record/performance on bets
2. Sports simulations for days without sports
3. Emergency override feature (for screentime but add in a sort of punishment)
4. Some sort of monetization function (ads, freemium, one time access purchase).

Could Have:

1. Option to select which sports to focus on
2. General prediction markets
3. "Parlay" of to-do items (i.e. read books, wash dishes, fold laundry).
4. Integration with other devices (Mac, desktop, iPads).

Will Not Have:

1. Real money betting
2. Parlays more than 3 legs
3. International/language support
4. Exorbitant/exploitative pricing
5. Advertising or any connection to actual sports betting

Section 3: Behavioral Requirements

Real time odds

1. The system updates odds and scores for live games at least every 30 seconds.
2. When odds change after a user opens a bet slip but before they confirm, the system shows the new odds and requires the user to confirm again.

Place bets with screentime

1. The system gives each user a daily screentime balance of 60 minutes (resets at midnight of local time)
2. When a user places a bet, the system subtracts the staked minutes from their screentime balance and adds the bet to their Open Bets list (list of current bets).
3. When a bet wins, the system adds the staked minutes plus winnings (based on the odds when the bet was placed) back to the user's balance within 5 minutes of the game ending.
4. When a user tries to stake more minutes than they have left, the system blocks the bet and shows "Not enough screentime" and shows their remaining balance. (error case)
5. When a user's screentime balance hits 0, the system blocks all new bets until midnight and shows a countdown to the reset.
6. When a game is postponed or cancelled, the system will void all bets on it and return the full amount to each user. (error case)
7. When a bet loses, the system marks it as Lost and moves it from Open Bets to Bet History within 5 minutes of the game ending.
8. When the clock hits midnight local time, the system sets the new day's allowance to 60 minutes plus winnings and minus losses from all bets placed the previous day. And a new betting allowance of 60 minutes is set for the current day.

Simple interface

1. The system lets a user place a bet on any game in 3 taps or fewer from the home screen.
2. The system shows a feed of all current live games with scores on the home screen (divided into categories the user can choose to view)
3. The system shows all current bets and amount of screen time at the top of the home screen.

Bet sharing / betting with friends

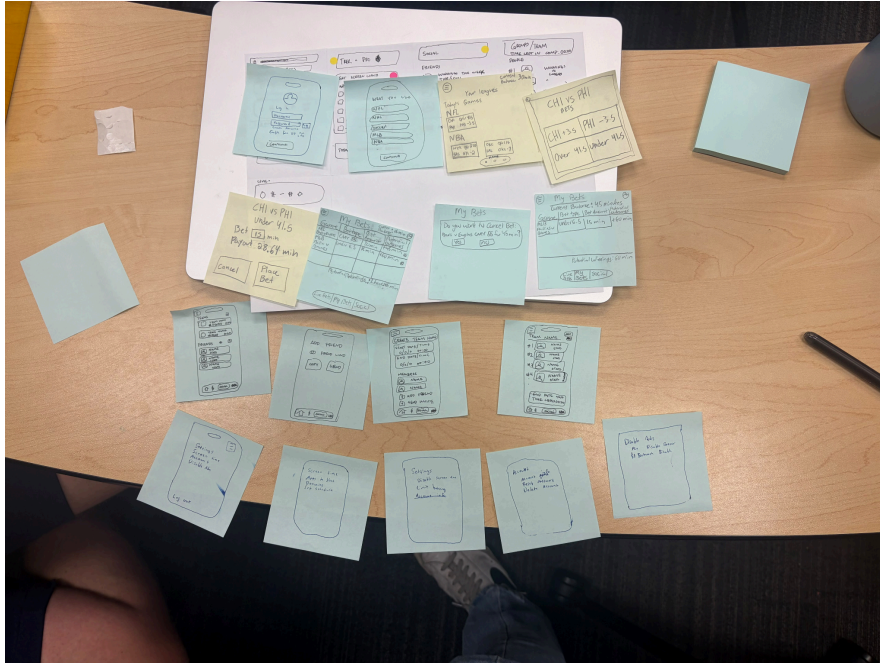

1. When a user sends a bet to a friend, the system lets them attach a custom reward or punishment of up to 100 characters (like "loser does the dishes") instead of screentime.
2. When a user taps Share on a bet, the system creates an image showing the teams, pick, odds, and stake.

AI Disclosure Statement - We used Claude and Gemini to review our draft and help to find gaps that we missed and to help with spelling and grammar errors.

Group Project: Design Sprint

Part 1 - Complete the Design Sprint

Everyone in our group was present for the in class design sprint (Will, Owen, Easton, Marcus)

2- Persona Alignment and Scope Check

Overall, our design addressed the need of our persona decently well but there were some major pain points. Our design addresses the pain points of losing the bet, post loss, and boredom. Losing the bet is solved because our product gives the high that Addicted_Adam is searching for without the financial implications of losing a large bet. Post loss is solved because Addicted_Adam currently feels shame and wants to hide the amount he bet. With our product, there are no financial implications and instead he can bet with screen time for the next day. Boredom is solved because our app is a way for Adam to be social and compete with friends about his bets so there is a social aspect to the betting.

We currently have gaps in preparation/research and with general navigation on our app. We need to better implement live game stats so Adam feels more prepared and can complete better research on his bets. We also noticed that our navigational layout was confusing and some of our language throughout the app was either too broad or confusing.

MoSCow:

Must Have:

6. Interface accessible to all users (works on iOS and Android)
7. Bet settlement (automatically paying out when a game ends) - has
8. Real-time/live sports updates, including odds -has (just not on MyBets page)
9. Betting screentime feature (have a set amount of screentime that you can bet with to get more / loose with bets) (User is betting with the next day's screentime) - has
10. Bet sharing (share bets between friends to have alternatives to screentime) - has

Should Have:

5. Overall record/performance on bets - does not have
6. Sports simulations for days without sports - has
7. Emergency override feature (for screentime but add in a sort of punishment) - does not have
8. Some sort of monetization function (ads, freemium, one time access purchase). - not yet

Could Have:

5. Option to select which sports to focus on - has
6. General prediction markets - does not have
7. "Parlay" of to-do items (i.e. read books, wash dishes, fold laundry). - does not have
8. Integration with other devices (Mac, desktop, iPads). - does not have

Will Not Have:

6. Real money betting - does not have
7. Parlays more than 3 legs - does not have
8. International/language support - does not have
9. Exorbitant/exploitative pricing - does not have
10. Advertising of or any connection to actual sports betting - does not have

Overall the prototype is functional but definitely needs some polishing. It has the general functionality we want but navigation and some crucial features are still missing.

3- Write AI Screen Specs

(navbar includes from left to right (home, my bets, social))

Screen 1: Home

- *What is it:* The first screen that appears after opening the app and acts as the hub for everything else. Users come back here to place bets and see overall stats and screentime.
- *What the user is trying to do:*
 - Quickly see what's on right now and future games.
 - Check how much screentime they have left.
 - Get to a bet in as few taps as possible (3 or fewer)
- *What they need:*
 - Their remaining screentime balance and a quick look at their open bets (always visible at the top)
 - A fee of live and upcoming games with current scores (sorted by sport categories they can choose to show or hide)
 - A clear way to tap into any game and start a bet
 - Easy access to settings and the other main sections (settings in a hamburger menu at the top) (other main pages along the bottom in a navbar that is labeled)
- *Success:* The user finds a game and starts a bet without hunting around, and always knows how much screentime they have left.
- *Constraints and error states:*
 - Scores and odds refresh at least every 30 seconds (to be up to date)
 - If the balance is 0, the screen makes it obvious betting is locked and shows a countdown to the midnight reset for the next day.
 - If there are no games on, the screen points the user to simulated games instead of sitting empty
 - Keep it simple, Nothing on the screen should compete/interfere with finding a game and betting

Screen 2: Game Detail

- *What is it:* A page for one specific game, reached by tapping a game from the Home feed or from My Bets.
- *What the user is trying to do:* Understand what's happening in the game and decide whether and how to bet. This is where Adam does his "research" so he feels prepared.
- *What they need:*
 - Live score, game status, and key live stats
 - Current odds for the bet options available
 - A clear way to pick a side and start a bet
 - Any bets the user already has on this game
- *Success:* The user feels informed enough to make a pick and gets into the bet flow easily.

- *Constraints and error states:*
 - Odds and stats update at least every 30 seconds
 - If a game is postponed or cancelled, the screen says so clearly and explains that all bets are voided and stakes returned
 - If a game has already ended, betting is unavailable and the final result shows

Screen 3: Bet slip (place a bet)

- *What is it:* The confirmation steps where a user locks in a pick from looking at the game's odds.
- *What the user is trying to do:* Choose how many minutes of screentime to stake, see what they could win or lose and confirm the bet.
- *What they need:*
 - The pick, the game, and the odds locked in
 - A way to enter (choose) the minutes they want to risk
 - What they'd get back if they win or if they lose
 - Their remaining balance after the stake
 - A way to confirm or back out (simple one click)
- *Success:* The user places a bet knowing exactly what's at stake and it shows up in their open bets right away.
- *Constraints and error states:*
 - If the odds change while the slip is open, show the new odds and make the user confirm again (only for current games)
 - If they try to stake more minutes than they have, block the bet and show "not enough screentime" and also show their remaining balance
 - If their balance is 0, block all bets
 - Stakes use the next day's screentime (say this in plain language to not confuse)

Screen 4: My Bets

- *What it is:* The place to track every bet, reached from the main navigation.
- *What the user is trying to do:* Check how current bets are doing, and look back at past results.
- *What they need:*
 - Open Bets with the live score and live game stats for each one, so they can see how each bet is going without leaving the page
 - Current odds on open bets where relevant
 - Bet History showing won, lost, and voided bets with the minutes gained or lost
 - Their overall record (wins, losses, total minutes won or lost)
 - A way to share a bet or send one to a friend
- *Success:* The user can tell at a glance which bets are winning, losing, or settled, and never has to guess what happened.
- *Constraints and error states:*
 - Settled bets move from Open Bets to Bet History within 5 minutes of the game ending, labeled Won or Lost
 - Voided bets (postponed or cancelled games) are labeled clearly and show the full stake returned

- If there are no bets yet, explain how to place one and link to Home
- Wording should be plain and specific. Users found the old labels too broad or confusing

Screen 5: Social

- What it is: The friends section, reached from the main navigation.
- What the user is trying to do: See how they stack up against friends, find and add friends, and see bets friends have challenged them with.
- What they need:
 - Stats for themselves and their friends (record, minutes won or lost)
 - A way to find friends, either by searching a username or sharing an invite link
 - Pending friend requests and bet challenges from friends
 - Groups (maybe called teams) where you can invite friends to compete for a selected period of time (start and end date)
- Success: The user can add a friend quickly and feels the competitive, social side of the app.
- Constraints and error states:
 - If a username search finds nothing, say so and suggest sending an invite link instead
 - If the user has no friends yet, explain the page and prompt them to invite someone
 - Friend stats should only show what friends have agreed to share

Screen 7: Screentime and Settings

- What it is: A settings area reached from the top of the page, including all screentime controls.
- What the user is trying to do: Control how the app works for them, especially how screentime is managed, and adjust their account.
- What they need:
 - Their daily screentime balance, how it resets, and how winnings and losses carry into the next day
 - Controls for screentime features, so the user isn't stuck with settings they can't change
 - Which sports to focus on in the Home feed
 - Account and notification options
 - Emergency screentime unlock (takes away time from the next day to view now) (have a limit per day use)
- Success: The user understands exactly how their screentime works and feels in control of it.
- Constraints and error states:
 - The daily balance starts at 60 minutes and resets at midnight local time, adjusted for the previous day's winnings and losses
 - Changes that affect screentime limits should be confirmed so they aren't changed by accident

- If the emergency screentime override is used, it adjusts the time for the next day's screentime.

4- Generate Digital Mockups

fd

5- Get Feedback on Both Prototypes

Product Notes:

User 1:

- Keep Home page simple
- Name of page above navigation dots
- Settings on the top of the page

User 2:

- Navigation on the Bottom is confusing
- See current game stats on Current Bets Page
- Options to control screentime features
- Is there a way to look up friends on the app
 - Share link or look up username
- Better language on My Bets and Social pages
 - Better explain purpose of Social page
- User stats of self and friends on social page
 - How much they have one or lost, ect
